INSTRUCTIONS FOR ORDERING PARTS:

1. ALL PARTS MUST BE ORDERED FROM YOUR DEALER.
2. GIVE MODEL NUMBER and SERIAL NUMBER that is stamped on the NAMEPLATE of your machine.
3. Order from your PARTS LIST, found below each illustration, as this is the ONLY means we have of identifying the parts you need. Order by the QUANTITY DESIRED, the PART NUMBER and the DESCRIPTION OF THE PART.

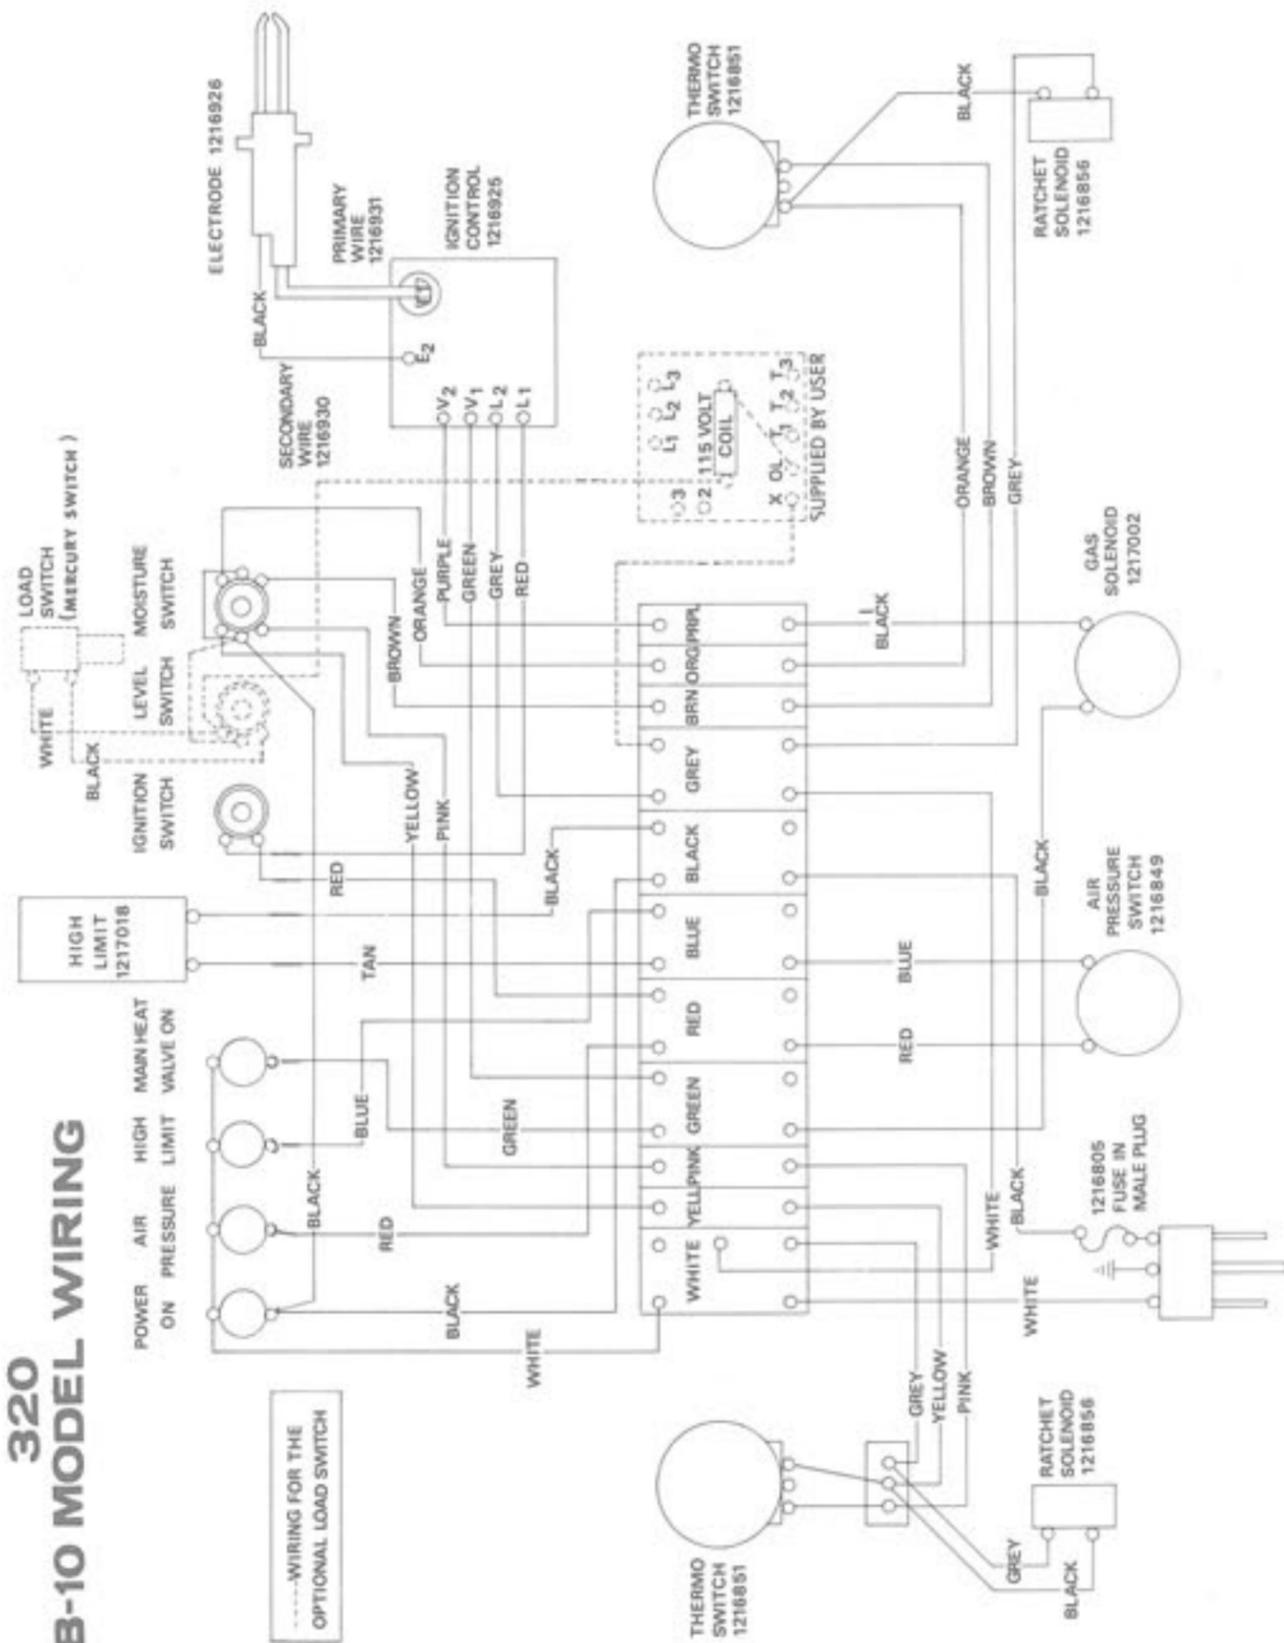

NOTE

The Company reserves the right to incorporate any changes in design without obligation to make these changes on units previously sold.

OWNERS NOTICE

TO INSURE WARRANTY CLAIMS, BE CERTAIN TO FILL
OUT AND MAIL WARRANTY CARD WITHIN 30 DAYS.

320 B-10 MODEL WIRING

SET UP INSTRUCTIONS

NOTE

The end of the dryer with the fan is considered the front. Left and Right is determined by standing behind the dryer and looking at the rear door.

1. Place dryer in a level position.
 - A. Permanent installation: Remove pole and wheels and place dryer on concrete slab or pier with a plank between concrete and skids. Anchor dryer down.
 - B. For Portable or Temporary installation: Place planks under full length of skids. Remove wheels or dig holes for wheels. Full weight of dryer must rest on the dryer skids. Dryer should be anchored down when empty.
2. Install Ratchet Assemblies and Guards.
3. Install Variable Drive Arm Assembly.
4. Install Wet Holding Hopper.
5. Install Cross Auger.
6. Install all guards and shields.
7. Connect GROUNDED THREE line 115 volt power to control cabinet using male (fused) and female electrical plugs shipped with dryer. When electrical connection is made, light #1 (power on) and

#3 (high limit switch) on control panel should come on.

8. On "E" model dryer connect powerline for motor to the magnetic starter in the starter box.

9. Connect gas supply to machine.

A. L.P. Gas - Advise your L.P. gas supplier that the dryer takes liquid from the tanks (not vapor). When the gas system is connected to the dryer, be sure an Excess Flow Valve is installed at the tank, preferably the one furnished with the machine as it will shut off quicker (in case of line breakage) than those normally furnished by the gas supplier. In any case NEVER have two Excess Flow Valves on the same line.

Use a minimum of 1/2" ID gas line between tank and dryer. On runs over 100 feet use a 3/4" ID diameter line. Connect the gas line from the tank to the short flexible hose on the dryer.

Gas pressure used should be kept as low as possible to maintain drying temperature; HOWEVER, never less than 5 pounds as indicated on pressure gauge.

B. Natural Gas - A minimum of 5 lbs. of operating pressure is required on all models. Use minimum two-inch line from Natural Gas regulator to dryer. Use reducing bushing to 1-1/4" just before connecting to pipe outside dryer control cabinet.

DANGER!

1. KEEP ALL SHIELDS IN PLACE.
2. DISCONNECT POWER SOURCE TO ADJUST OR SERVICE.
3. MAKE CERTAIN EVERYONE IS CLEAR OF EQUIPMENT BEFORE APPLYING POWER.
4. KEEP HANDS, FEET, AND CLOTHING AWAY FROM POWER DRIVEN PARTS IN MOTION.

FAILURE TO HEED MAY RESULT
IN PERSONAL INJURY

OPERATING INSTRUCTIONS

1. Make sure all safety shields and guards are in place.
2. Turn off Ignition Switch.
3. Turn off all gas valves.
4. Dryer must operate at 5 lbs. gas pressure. To prevent problems caused by excessive gas pressure loosen Pressure Regulator screw to reduce gas pressure to zero. Also loosen Modulating Valve handle. (Explanation) Dryers are sometimes tampered with and the Modulating Valve handle may have been turned down resulting in a wide open condition.
5. Turn on Level Auger Switch (or load switch) to the automatic position.
6. Fill dryer with grain.
7. Slowly open gas valve at LP tank and check for leaks.
8. Start fans when dryer is full. Light #2 (Air Pressure Switch) on control cabinet will come on. (Trouble see page 6.)
9. Open Flip Valve on LP models.

STARTING BURNER

10. INITIAL START UP OF NEW DRYER. Turn on the Ignition Switch to start burner. (Light #4 Main Heat Valve will come on.) Partially open Hand Valve and turn Pressure Regulator screw until 5 lbs. of pressure has been reached. (Only turn Pressure Regulator screw when Main Heat Valve light is on.) If Ignition does not take place in 6 or 7 seconds, turn off Ignition Switch, wait one minute and repeat cycle.

NOTE

The start up procedure is critical because the liquid gas must be vaporized. Excess gas flow at the start will cause freeze ups. That is why you must start with a slightly open Hand Valve. Once the burner is going, the heat causes vaporization and a steady-controlled heat is established. The Hand Valve can now be fully opened. Repeat cycle if ignition fails or freeze up occurs.

SETTING TEMPERATURE

11. The temperature is regulated by the Modulating Valve. To increase the temperature, turn the

handle in. To reduce the temperature, turn the handle out. (See reference 21, Page 3 for operating temperatures of various grains.)

SHUT-OFFS AND RESTARTS

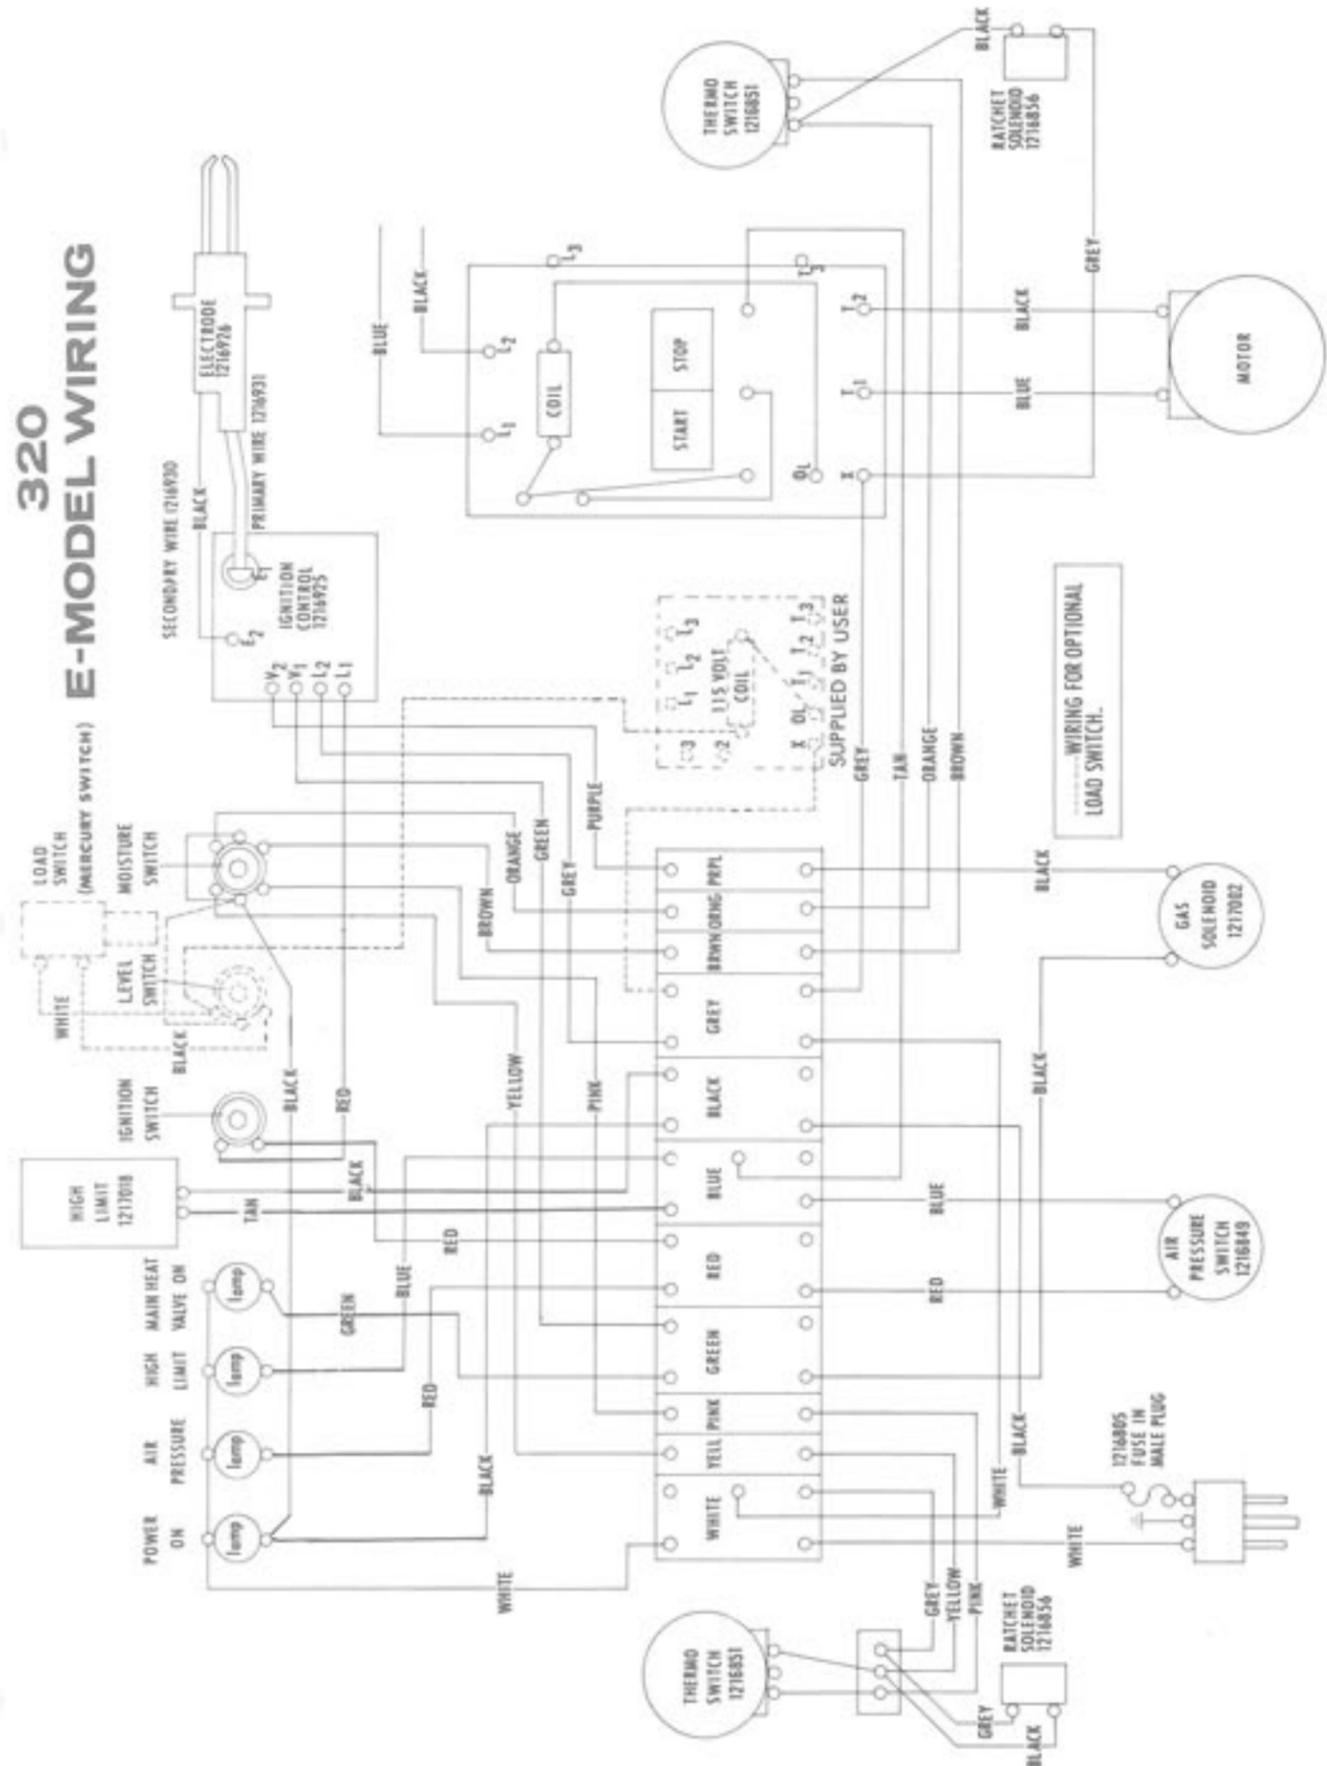

12. After initial operation over several hours of running, the Pressure Regulator and Modulating Valve will be functioning properly. When stopping the dryer, shut off the heat and let the grain cool. (Turn off Ignition Switch and run fans for 15 to 20 minutes with cool air.) Shut off Hand Valve, Flip Valve, and Tank Valve on LP models. To restart, open Tank Valve, Flip Valve, turn on Ignition Switch, and gradually open Hand Valve. Remember to open Hand Valve gradually to prevent freeze ups.
13. The cooling section of the dryer will have wet grain in it, and will not be dried on the first run. This grain will have to be recycled back into the heating section.
14. Make sure Automatic Moisture Control Switch is in "Off" position. In order to dry all the corn in the upper section, it will require approximately one hour of continuous heat to dry the first load from 30% to 12% moisture.
15. For safe bin storage, the grain is normally dried to 13% moisture. After one hour of drying on the first load, turn Moisture Control Switch to "Manual" position. This will engage Ratchet Solenoids and begin unloading the grain. When grain in cooling section has moved through and dried grain begins to auger out, test it for moisture content. If moisture content is too high, slow the unloading down. If moisture content is too low, speed unloading up.
 - A. By turning Variable Crank arm CLOCKWISE to SPEED UNLOADING and COUNTERCLOCKWISE to SLOW UNLOADING. This is normally used for fine adjustment.
16. To change the speed of unloading, a combination of two adjustments is available.
 - A. By turning Variable Crank arm CLOCKWISE to SPEED UNLOADING and COUNTERCLOCKWISE to SLOW UNLOADING. This is normally used for fine adjustment.

CAUTION

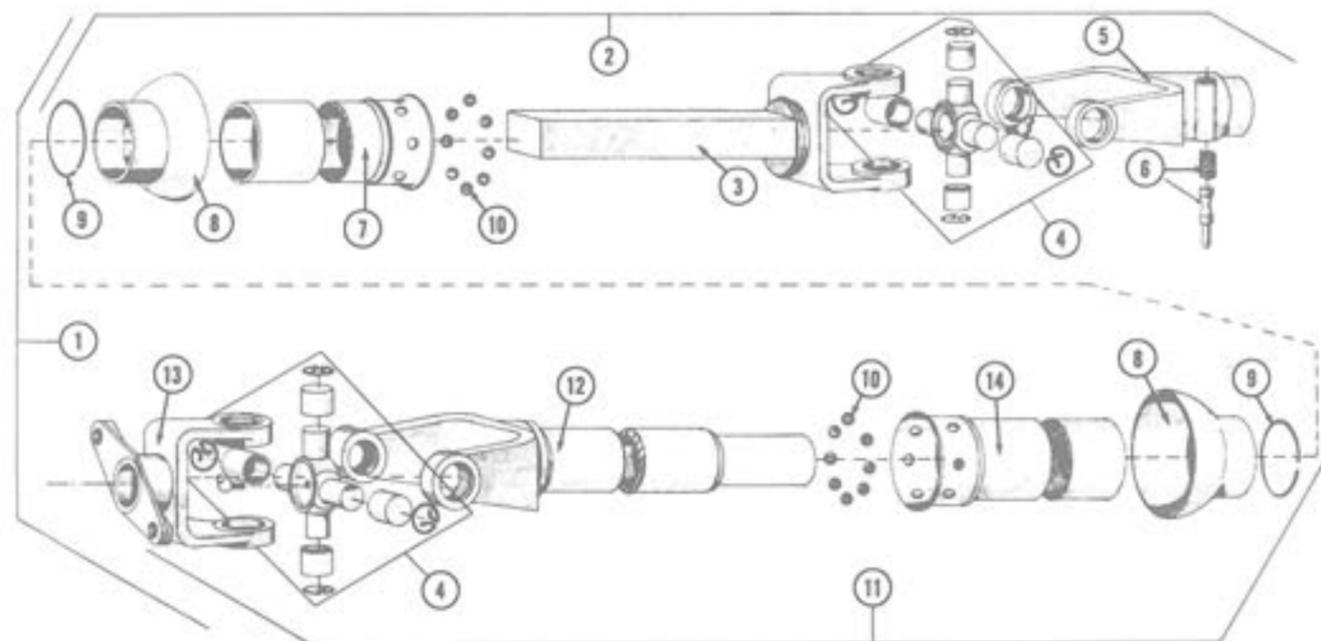

Run through the complete cycle from fast to slow at least once every day when machine is being operated. This will keep all moving parts free. Do not put extreme pressure on belts. ADJUST VARIABLE SPEED PULLEY ONLY WHEN MACHINE IS OPERATING.

- B. The Feed Rolls can be adjusted independently of the side augers by sliding the "Eccentric

320 E-MODEL WIRING

TRACTOR PTO ASSEMBLY NUMBER 0016600

REF	PART NO.	DESCRIPTION	REF	PART NO.	DESCRIPTION
1	0016600	PTO Drive Shaft	9	0026625	External Snap Ring
2	0026620	Tractor Half Assembly w/O. D. Yoke	10	0026606	3/8" Diameter Ball
3	0026627	Male Shaft & Yoke Weldment	11	0026621	Complete Machine Half PTO w/Shear Flange
4	0026628	Universal Joint Repair Kit	12	0026622	Female Shaft & Yoke Weldment
5	0027651	Quick Detachable Yoke, Only	13	0027652	Flange Yoke 1-1/4 Bore
6	0026629	Safety Lock Pin & Spring Kit	14	0026623	Male Guard Tube
7	0026624	Female Guard Tube			
8	0026626	Bell Shield			

Connecting Rod' along the slotted bracket on the Eccentric Sprocket. The Eccentric Sprocket is located at the center of the base on the drive end of the dryer. Moving the Eccentric Connecting Rod TOWARDS THE CENTER of the sprocket will DECREASE the stroke and SLOW down the UNLOADING of the Feed Rolls. Moving it AWAY from the CENTER of the sprocket will INCREASE the stroke and SPEED UP the UNLOADING of the Feed Rolls.

CAUTION

NEVER MAKE ADJUSTMENT ON SPROCKET UNTIL IT HAS COME TO A COMPLETE STOP.

Normal factory setting is for two teeth. When removing more than 10 points of moisture, it may require slowing down to one tooth. When removing less than 10 points of moisture, it may require speeding up to three or more teeth.

NOTE

Be careful not to run more grain out of the Feed Rolls than the Side Augers can carry away!

- After your dryer is operating properly and is discharging grain at the desired moisture content for one hour, switch to "Automatic Moisture Control." Turn the "Moisture Control Switch" to Automatic position, then set the Moisture Control on each side of the dryer by turning the indicator knob to the point that will just maintain Feed Roll operation. Most likely each moisture control will have a slightly different setting. Normally they will be set within the limits shown in the following chart.

APPROXIMATE SETTING FOR SHELLED CORN AND MOST SMALL GRAINS

Thermometer Setting	Set Control Dial At	To Get - Percent Moisture
140°	3.5	13 - 14%
180°	4.0	14 - 15%
180°	4.5	13 - 15%
180°	5.0	12 - 13%

If the moisture content of the grain coming out of the dryer starts to increase, increase the setting of the control one mark at a time until the correct moisture content is reached. Allow ample time between adjustments for machine to correct itself, suggested time to be 1 hour.

Adjust the unloading mechanism to correspond with the rate of feeding of the grain by the automatic control. These adjustments will only be slight if you have had your dryer operating correctly before switching it to "Automatic Moisture Control."

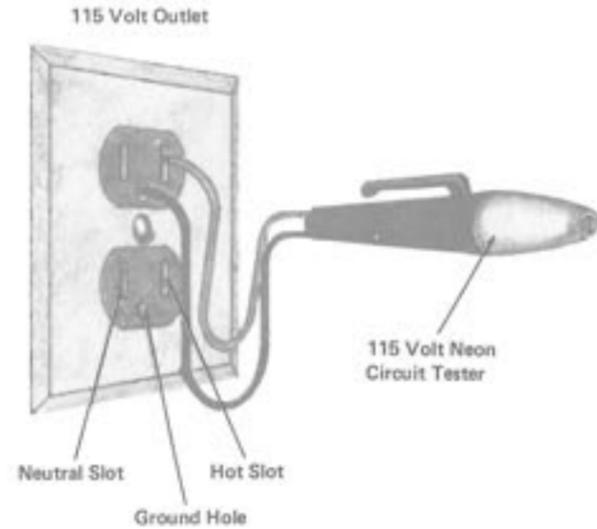

The speed of the Variable Drive should be fast enough to cause the Automatic Moisture Controls to operate intermittently but having the Feed Rolls engaged 85% to 90% of the time. If the unloading mechanism is working too slow, the Moisture Control Solenoids will operate constantly and the grain will come out drier than desired.

- Your dryer is a continuous flow dryer and it is necessary to hold the grain in the dryer for a period of time when finishing a run. Ratchet Pawls should be disengaged as described in Instruction Note 13. This will give the grain remaining in the dryer time to become dried. Then turn Moisture Control Switch to Manual position. Allow about 30 minutes of drying time for high moisture grain (30%) and proportionately less for drier grain.
- If you should accidentally get a foreign object in the grain feeding mechanism, shear pin on Sprocket No. 1216401 at lower left side (as you face drive end of dryer) will help to protect the feeding parts from breakage. Replace this pin when necessary. Do not use hardened shear pins.
- If you have followed the instructions carefully your dryer will operate continuously without watching or adjusting as long as you keep it full of grain.

21. DRYING CHART

Types of Grain	Drying Temp.
Corn	180°F to 200°F
Grain Sorghum	160°F to 180°F
Wheat or Oats	160°F to 170°F
Soybeans or Barley	130°F to 140°F

DRYER ELECTRICAL SYSTEM POLARITY & GROUND TEST

- 1) The right hand slot is hot.
- 2) The ground hole is properly grounded.

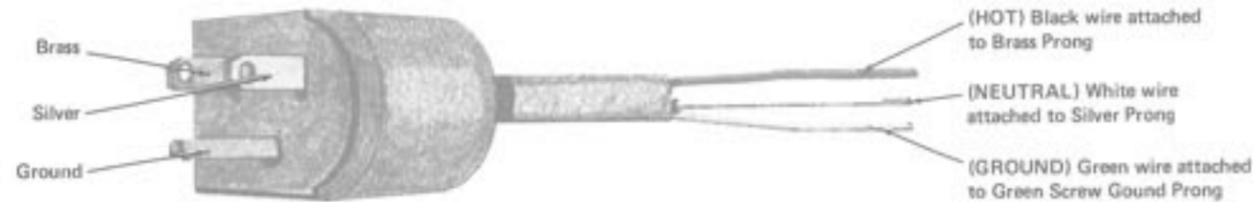

If the Tester does not light when inserted as shown, (AND THIS WAY ONLY) have an electrician look at your service as there is something wired wrong. This is the Standard Electrical Code for all wiring. The reason being that when the Three Prong Fused Plug (pictured below) is inserted into the outlet, The Dryer Electrical System will properly polarized for the Fenwal Ignition System.

NOTE

If an extension cord is used, it MUST be a Three Wire Cord with a Three Prong Plug and a Three Hole Socket wired to the above code.

On P.T.O. Dryers that have an alternator to supply the 115 Volt power, the Dryer MUST BE PROPERLY GROUNDED.

Using a 115 Volt Neon Circuit Tester, (which can be bought for less than a \$1.00 at most any hardware store) insert as shown. It will light proving two things.

(Above) The Three Prong Fused Male Plug Pig Tail as it comes out of the Dryer Control Cabinet.

IGNITION

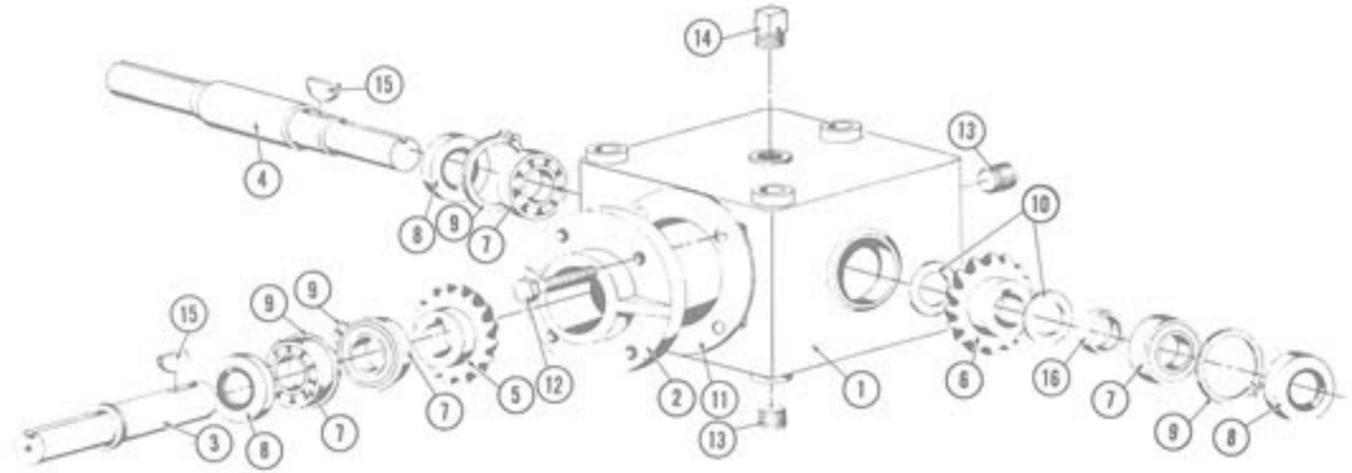

OPERATION

Upon a call for heat, power is applied to the control board, creating the spark and powering the gas valve. Electronic timing allows the system to continue to spark and hold the gas valve open for a specified trial for ignition period. If a flame is not present at the end of the trial for ignition period, the system will

lockout. If a flame is present, the system will continue to operate; provided the electrodes are immersed in the flame.

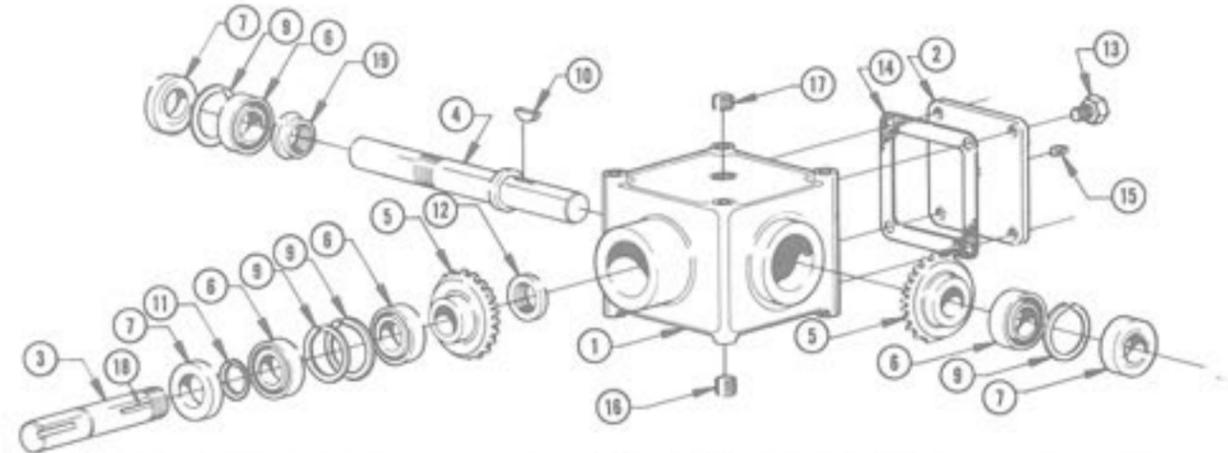

In the spark source, a capacitor is charged and discharged rapidly through the primary of high voltage transformer. The current to charge the capacitor also energizes the valve control circuit so that as long as

this action continues, the valve will remain open. The capacitor is discharged by a solid state switch, triggered by a neon circuit.

The flame detector monitors the spark current and the flame conductance to ground. If the spark of the flame is not present, feedback to the spark source removes power from the valve control circuit.

LOCATION OF ELECTRODE TIP

The electrode assembly should be located so that the tips are inside the flame envelope and about 1/2 inch above the base of the flame. **IMPORTANT:** Ceramic insulator should not be within or close to the flame pattern. Study the illustration before positioning the electrodes.

NOTE

Electrode assemblies are precision components and should not be adjusted or disassembled. Electrodes should have a gap spacing of 0.125" \pm 0.032". If this spacing is not correct, return the electrode assembly to the factory for replacement. Electrodes within their ceramic casing are **NOT** field adjustable. Adjust only the electrode mounting bracket. **WARNING: HIGH VOLTAGE.**

SAFETY CHECKS

1. Manually shut off the gas supply and apply power to the control board. The system shall lockout after the trial for ignition period. Check that there is no voltage output between terminals V1 and V2 using a suitable voltmeter or neon tester.

2. Manually open the gas valve and apply power to the control unit. The system shall lockout after the trial for ignition period and there shall be no voltage between terminals V1 and V2 under the following conditions:

- (1) The low voltage electrode is shorted to the ground.
- (2) The high voltage electrode is shorted to ground.
- (3) The electrodes are shorted together.

NOTE

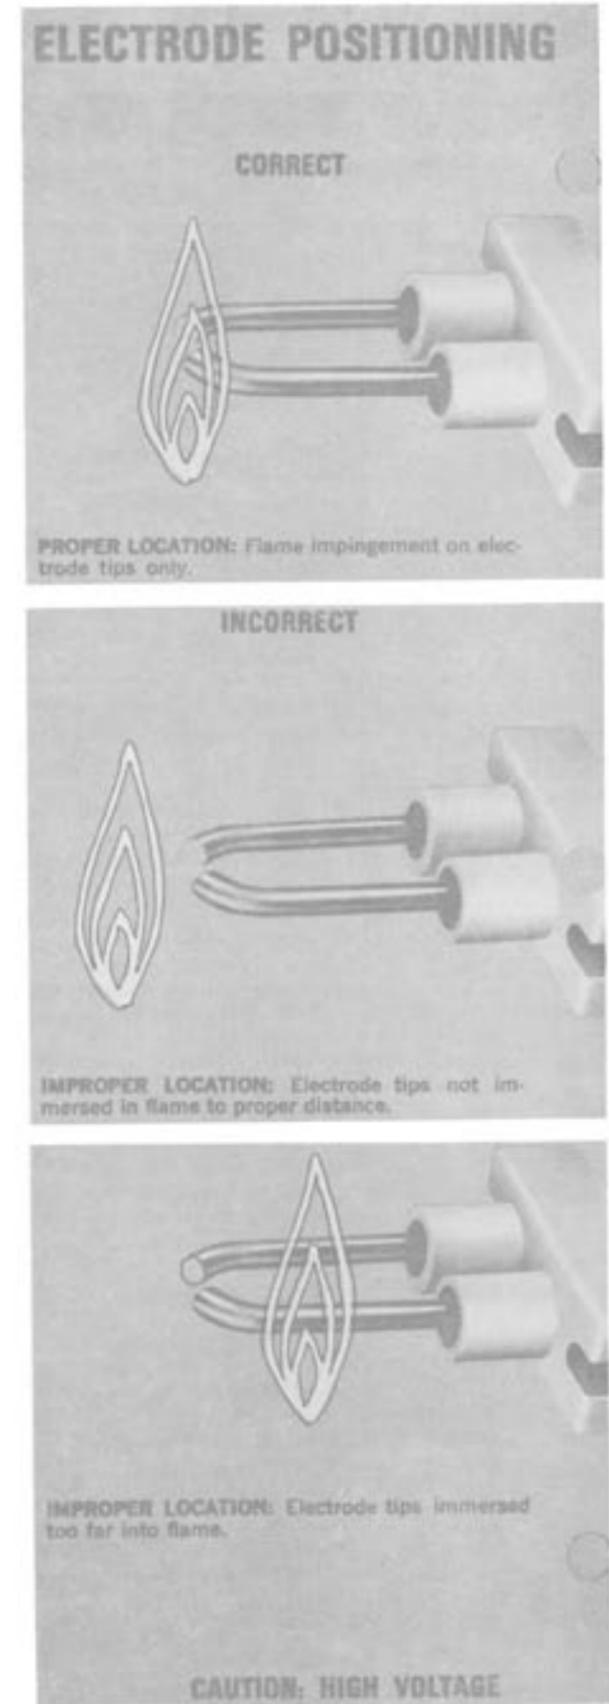

Recycle system before each test.

CAUTION

Use well insulated screwdriver for shorting electrodes.

REPAIRS

The Ignition System is not field repairable. Faulty units should be returned to the factory for repair or replacement.

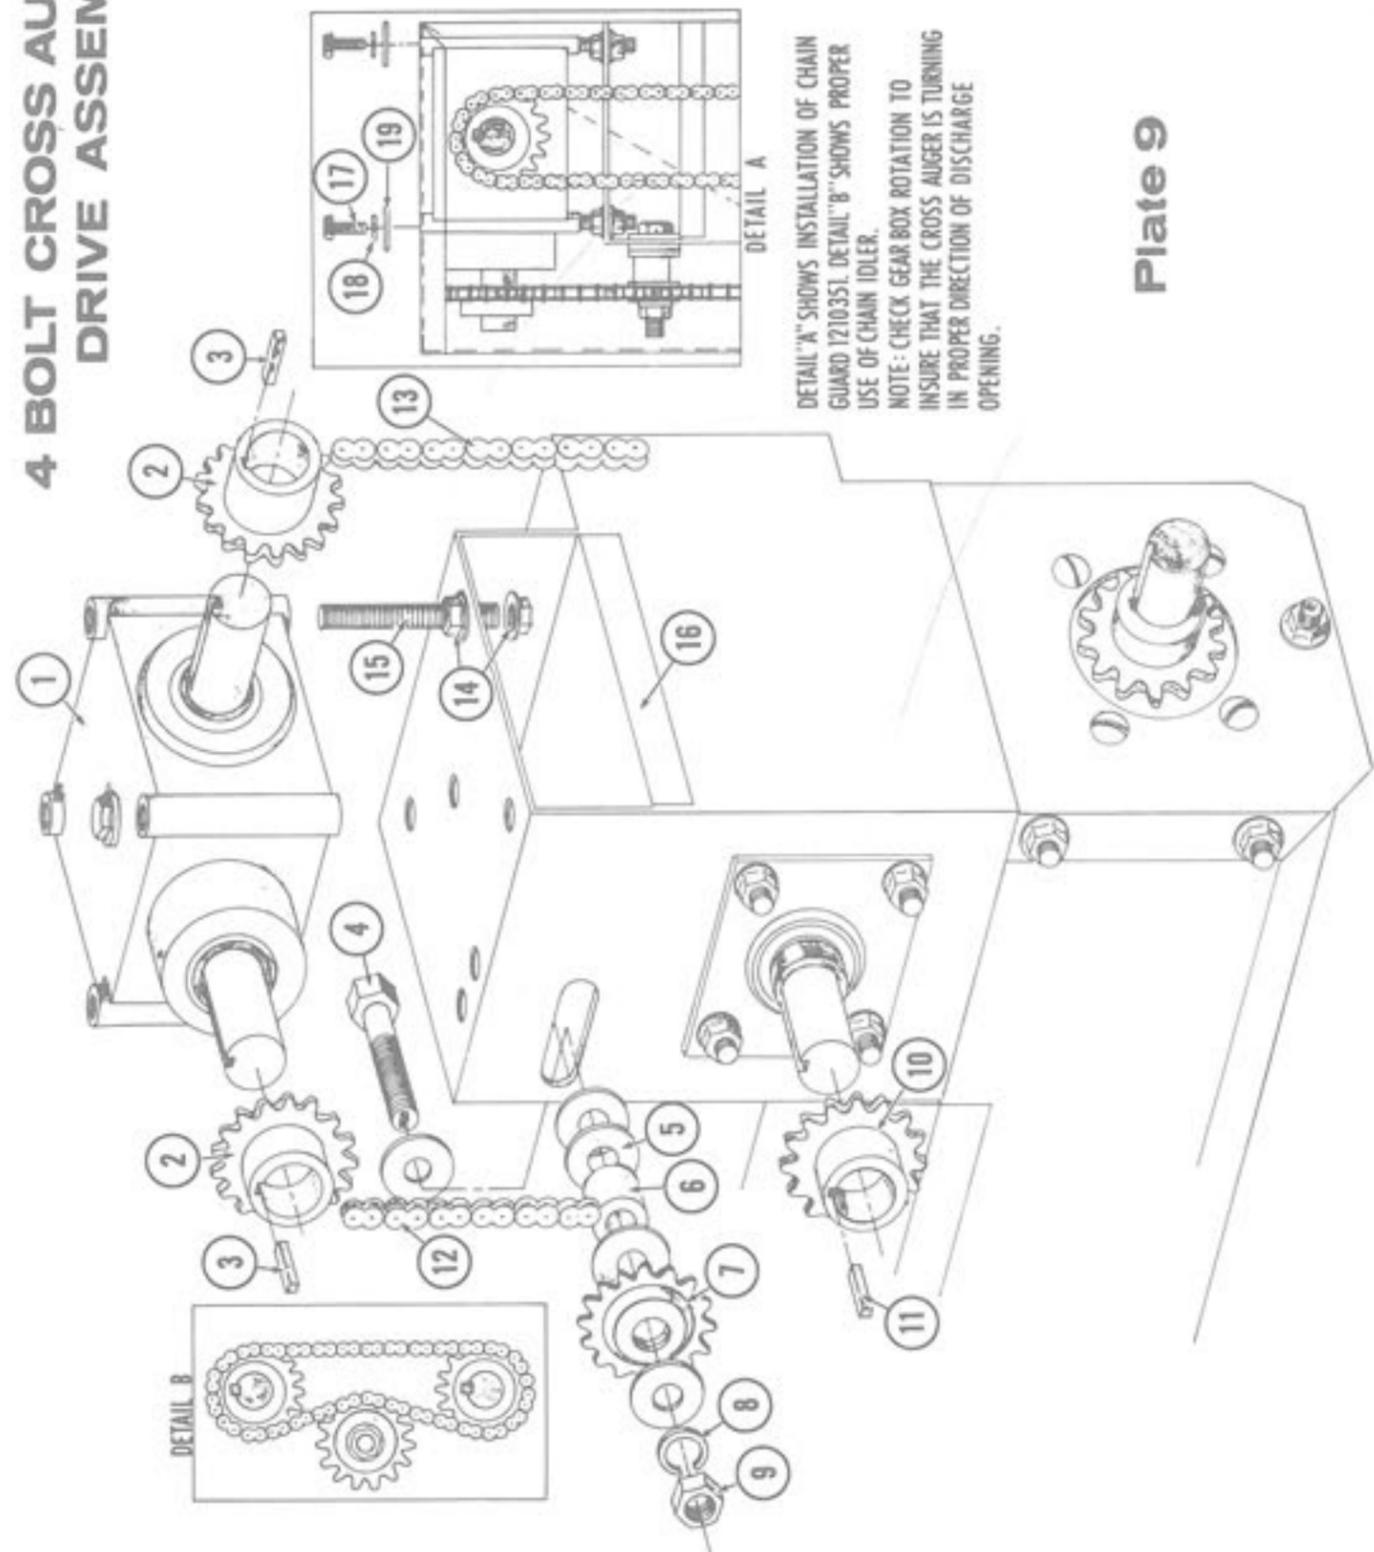

TROUBLE SHOOTING

PROBLEM	POSSIBLE CAUSE AND SOLUTION	PROBLEM	POSSIBLE CAUSE AND SOLUTION
1. Lights do not work.	(a) No electricity. Light bulbs burned out. (b) Fuse blown. (c) Broken or loose wire.		(h) Air Pressure Switch not functioning. (i) Broken wire from ignition board to electrodes. (j) Ignition board faulty - replace only.
2. High Limit Light does not work.	(a) Light bulb burned out. (b) High Limit tripped out. (Reset by pushing Red Button.) (c) Switch itself burned out. (Replace)	6. Heat shuts off.	(a) Dryer has run low on grain. (b) Modulating Valve faulty. (c) High Limit Control tripped out. (d) Solenoid faulty. (e) Out of gas. (f) Faulty or broken electrodes. (g) Machine not grounded.
3. Electric circuit out of order.	(a) Check circuit with wiring diagram furnished with instructions.		
4. Air Pressure Switch not functioning.	(a) Dryer must be full of grain to operate. If dryer runs out of grain, the air will escape freely and loss of air pressure causes air pressure switch to open circuit. (b) Air tube from pressure switch into dryer may be filled with chaff. (c) Adjust setting for less pressure. To close circuits, turn adjusting screw counterclockwise. CAUTION: DO NOT adjust to point that light will stay on when fans are not running.	7. Not enough heat.	(a) Valves from gas supply are not fully open. (b) Increase pressure at pressure regulator. (On L. P. units, this is set at factory for approximately 7 to 8 pounds. However, to increase gas flow on L. P. units, turn adjusting screw in.) (c) Burner partially plugged. Remove and clean. (d) Hand valve not fully open. (e) Adjust Modulating Valve.
5. If flame does not light. (Fenwal Ignition)	(a) Electrodes not positioned in flame properly. (b) Electric Power not on. (c) 15 AMP fuse in plug, blown. (d) Machine not grounded. Connect 3 prong plug to 115V grounded service. (e) Gas not on. Modulating valve not open far enough. (f) Gas solenoid not opening. (Faulty or loose wire.) (g) High Limit Control (reset) tripped out.	8. Gas lines frosting up.	(a) When first starting burner, open the Main Hand Valve only partially until the unit becomes warm. (b) Gas valve on tank not completely open. (c) Dirty strainer - clean. (d) Check gas line for leaks.
		9. Automatic Moisture Control does not work.	(a) Solenoid is burned out or a wire is broken. Check and make replacement. In the meantime, OPERATE DRYER MANUALLY. (b) Loose or broken wire at solenoid or switch. (c) Switch shorted out.

 NOTE: CHECK GEAR BOX ROTATION TO INSURE THAT THE CROSS AUGER IS TURNING IN PROPER DIRECTION OF DISCHARGE OPENING.

Plate 9

LUBRICATION

All bearings on the grain augers are pre-lubricated and require no further attention. The bearings on the fan shafts of the dryers should be lubricated with regular gun grease every 100 hours of operation.

with number 10 oil. When you stop using the dryer, grease and oil all parts.

CAUTION

DO NOT OVER GREASE.

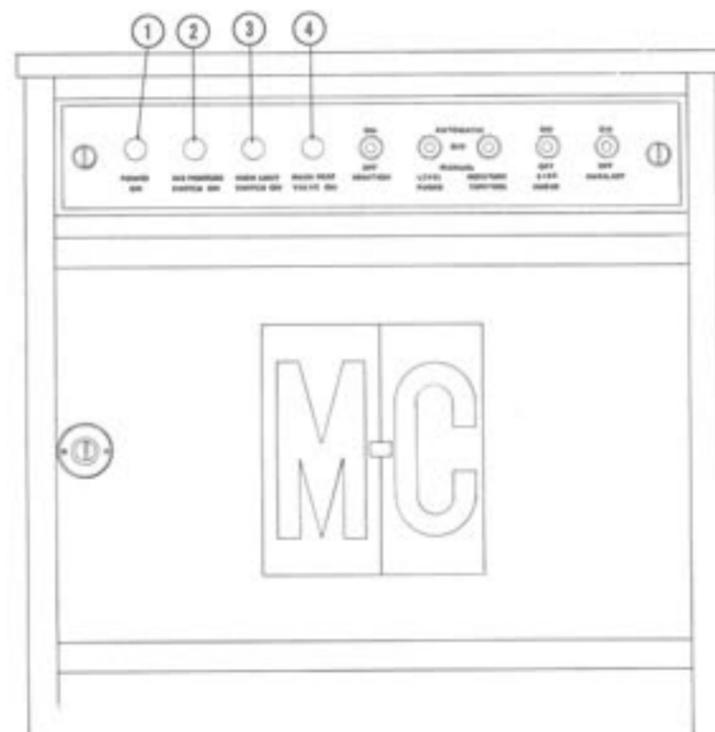

Excess greasing blows out seals. All other parts - ratchets, ratchet drive and chains, should be oiled

NOTE

Be sure to put 90 weight oil in the gear box before operating dryer.

CARE SHOULD BE TAKEN TO AVOID GETTING OIL INTO THE RATCHET PAWL SOLENOIDS OR ON BELTS.

CONTROL PANEL - ELECTRIC & GAS CONTROL

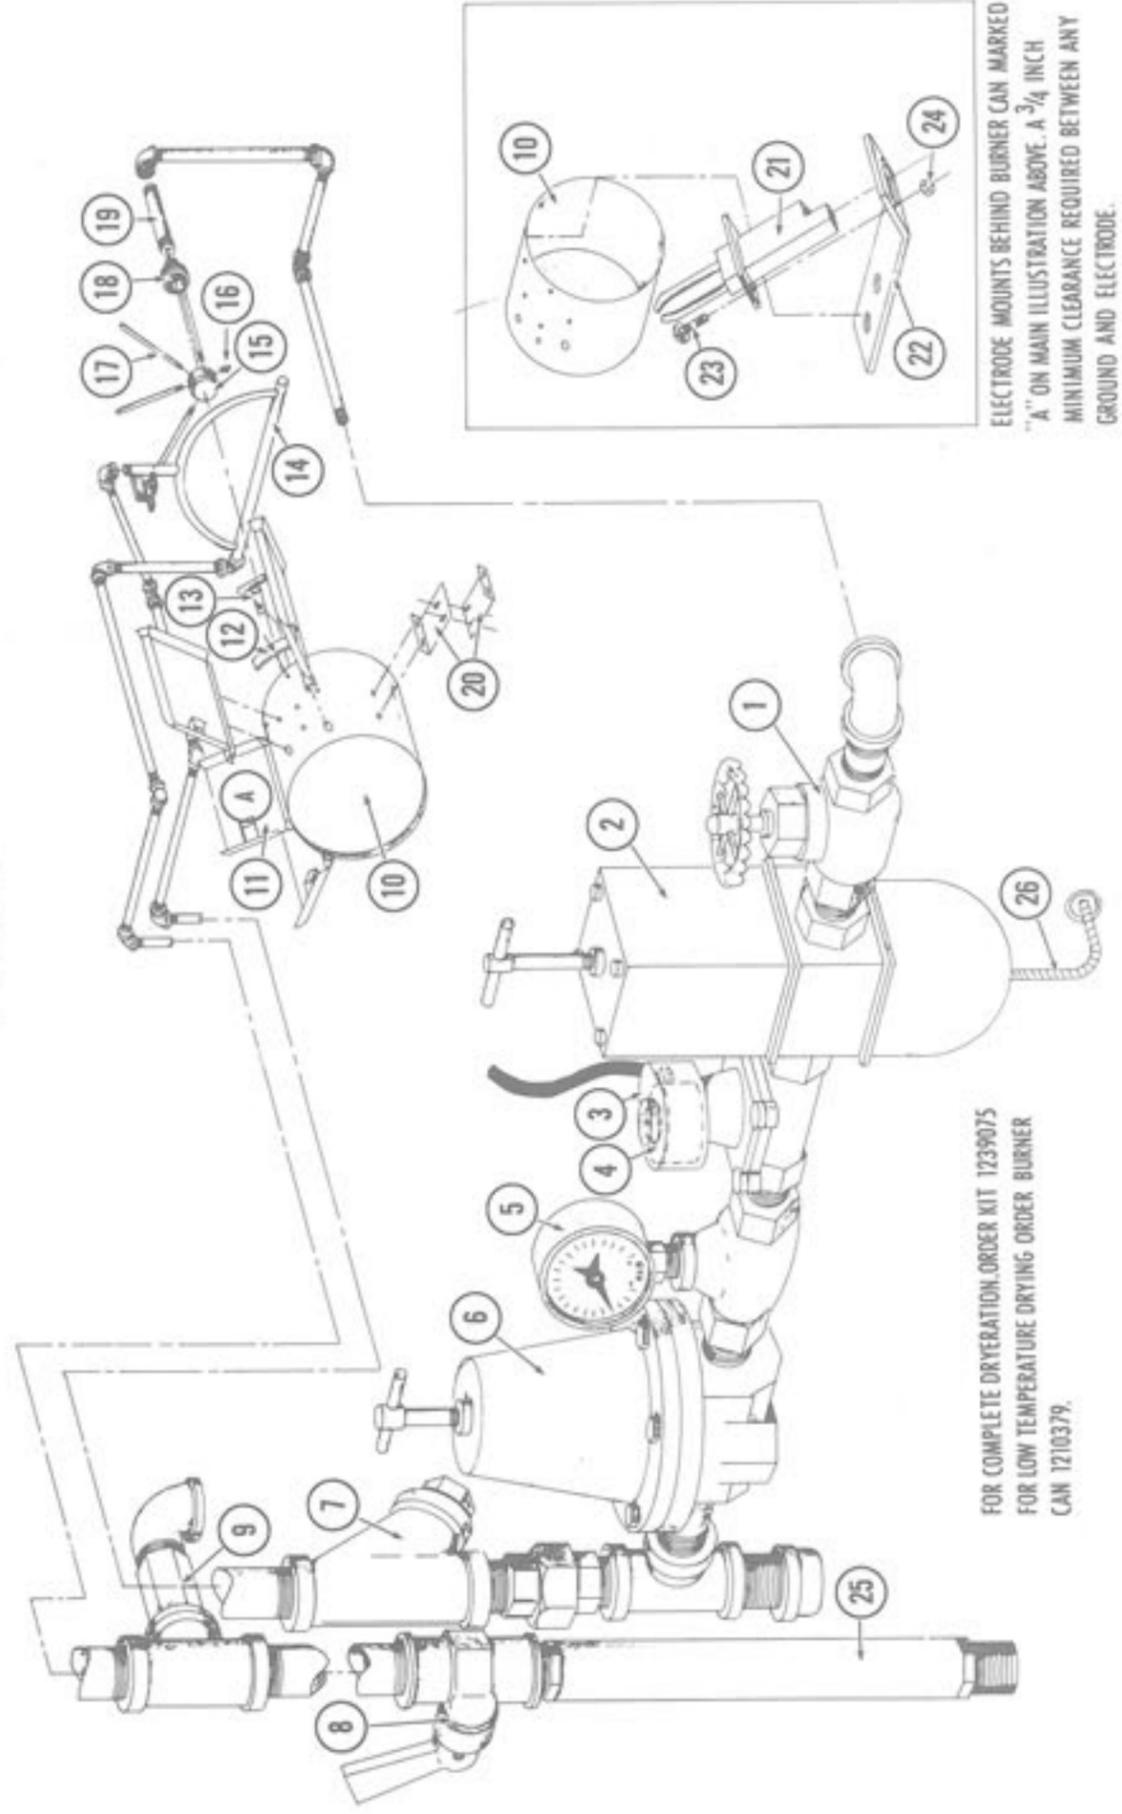

The Control Panel consists of temperature and safety controls. There are four lights wired in series with controls to indicate operation.

Control Lights:

- No. 1 Lights when electric power is on.
- No. 2 Lights when fan is running (air pressure completes circuit to ignition switch.)
- No. 3 Lights when high limit control circuit is closed. This indicates the high limit temperature safety device is operating.
- No. 4 Lights when Fenwal Ignition Switch is turned on and the electrodes are firing.
